

Exercise 1.1 The following statement is in While:  $y:=1; \text{while } \neg(x=1) \text{ do } (y:=y*x; x:=x-1)$

Exercise 1.2 Assume that the initial value of the variable  $x$  is  $n$  and that the initial value of  $y$  is  $m$ . Write a statement in While that assigns  $z$  the value of  $n$  to the power of  $m$ , that is

$n \star \dots \star n$

$m$  times

Give a linear as well as a graphical representation of the abstract syntax.

$z:=1; \text{while } \neg(y=0) \text{ do } (z:=z*x; y:=y-1)$

Exercise 1.8 Assume that  $s \ x = 3$  and determine  $B[\neg(x = 1)]s$ .

$\rightarrow B[[\sim(x=1)]]s$

$\rightarrow B[[\sim(A[[a1]]s = A[[a2]]s)]]s$

$\rightarrow B[[\sim(A[[x]]s = A[[n]]s)]]s$

$\rightarrow B[[\sim((s \ x) = N[[1]])]]s$

$\rightarrow B[[\sim(3=1)]]s$

$\rightarrow \sim(ff)$

$\rightarrow tt$

Exercise 2.3 Consider the statement  
 $z:=0; \text{ while } y \leq x \text{ do } (z:=z+1; x:=x-y)$

Construct a derivation tree for this statement when executed in a state where  $x$  has the value 17 and  $y$  has the value 5.

$\langle z:=0, s \rangle \rightarrow s \ 0 \ 17 \ 5$

T1

$\langle z:=0; \text{ while } y \leq x \text{ do } (z:=z+1; x:=x-y), s \rangle \rightarrow s \ 325$

T2

T3

---

$\langle \text{while } y \leq x \text{ do } (z := z+1; x := x-y), s \ 0 \ 17 \ 5 \rangle \rightarrow s \ 3 \ 2 \ 5$

T2 is a derivation tree with root

$\langle z := z+1; x := x-y, s \ 0 \ 17 \ 5 \rangle \rightarrow s \ 1 \ 12 \ 5$

and T3 is a derivation tree with root

$\langle \text{while } y \leq x \text{ do } (z := z+1; x := x-y), s \ 1 \ 12 \ 5 \rangle \rightarrow s \ 2 \ 7 \ 5$

$\langle \text{while } y \leq x \text{ do } (z := z+1; x := x-y), s \ 2 \ 7 \ 5 \rangle \rightarrow s \ 3 \ 2 \ 5$

$\langle z := z+1, s \ 2 \ 7 \ 5 \rangle \rightarrow s \ 3 \ 7 \ 5 \quad \langle x := x-y \rangle \rightarrow s \ 3 \ 2 \ 5$

---

$\langle z := z+1; x := x-y, s \ 2 \ 7 \ 5 \rangle \rightarrow s \ 3 \ 2 \ 5 \quad T4$

---

$\langle \text{while } y \leq x \text{ do } (z := z+1; x := x-y), s \ 2 \ 7 \ 5 \rangle \rightarrow s \ 3 \ 2 \ 5$

Where  $s \ 3 \ 7 \ 5 = s[z \rightarrow 3][x \rightarrow 7][y \rightarrow 5]$ ,  $s \ 3 \ 2 \ 5 = s[z \rightarrow 3][x \rightarrow 2][y \rightarrow 5]$  and T4 is a derivation tree with root with

$\text{while } y \leq x \text{ do } (z := z+1; x := x-y), s \ 3 \ 2 \ 5 \rangle \rightarrow s \ 3 \ 2 \ 5$

Exercise 2.4 Consider the following statements

- $\text{while } \neg(x=1) \text{ do } (y:=y \star x; x:=x-1)$

It terminates when only  $x \geq 1$ . If  $x$  is less than one it will loop forever.

- $\text{while } 1 \leq x \text{ do } (y:=y \star x; x:=x-1)$

It always terminates. While  $x$  is greater or equal than one it will eventually terminate.

- while true do skip

It always loops, because while true it will skip and never terminates.

Exercise 2.6 Prove that the two statements  $S_1; (S_2; S_3)$  and  $(S_1; S_2); S_3$  are semantically equivalent. Construct a statement showing that  $S_1; S_2$  is not, in general, semantically equivalent to  $S_2; S_1$ .

$S_1; S_2$

$$\langle s_1, s \rangle \rightarrow s', \langle s_2, s' \rangle \rightarrow s''$$

---

$$\langle s_1; s_2 \rangle \rightarrow s''$$

For example:  $x := x - y; y := x * y$

$$S_1 \rightarrow x := x - y$$

$$S_2 \rightarrow y := x * y$$

$$x = 3$$

$$y = 1$$

$$\langle x := x - y, s_{31} \rangle \rightarrow s_{21}, \langle y := x * y, s_{21} \rangle \rightarrow s_{22}$$

---

$$\langle x := x - y; y := x * y, s_{31} \rangle \rightarrow s_{22}$$

$S_2; S_1$

$$\langle x := x - y, s_{31} \rangle \rightarrow s_{33}, \langle y := x * y, s_{21} \rangle \rightarrow s_{03}$$

---

$$\langle x := x - y; y := x * y, s_{31} \rangle \rightarrow s_{03}$$

Exercise 2.11 The semantics of arithmetic expressions is given by the function A. We can also use an operational approach and define a natural semantics for the arithmetic expressions. It will have two kinds of configurations:

$\langle a, s \rangle$  denoting that a has to be evaluated in state s, and z denoting the final value (an element of Z).

The transition relation  $\rightarrow_{\text{Aexp}}$  has the form  $\langle a, s \rangle \rightarrow_{\text{Aexp}} z$

where the idea is that a evaluates to z in state s. Some example axioms and rules are

$$\langle n, s \rangle \rightarrow_{\text{Aexp}} N[n] \quad \langle x, s \rangle \rightarrow_{\text{Aexp}} s \ x$$

$$\langle a_1, s \rangle \rightarrow_{\text{Aexp}} z_1, \langle a_2, s \rangle \rightarrow_{\text{Aexp}} z_2$$

---

$$\langle a_1 + a_2, s \rangle \rightarrow_{\text{Aexp}} z \quad \text{where } z = z_1 + z_2$$

Complete the specification of the transition system.

$$\langle a_1, s \rangle \rightarrow_{\text{Aexp}} z_1, \langle a_2, s \rangle \rightarrow_{\text{Aexp}} z_2$$

---

$$\langle a_1 \star a_2, s \rangle \rightarrow_{\text{Aexp}} z$$

$$\langle a_1, s \rangle \rightarrow_{\text{Aexp}} z_1, \langle a_2, s \rangle \rightarrow_{\text{Aexp}} z_2$$

---

$$\langle a_1 - a_2, s \rangle \rightarrow_{\text{Aexp}} z$$

Exercise 2.17 Extend While with the construct repeat S until b and specify the structural operational semantics for it. (The semantics for the repeat-construct is not allowed to rely on the existence of a while-construct.)

$[\text{repeat}_{\text{sos}}] \langle \text{repeat } s \text{ until } b \rangle \Rightarrow$

$\langle S; \text{if } b \text{ then skip else } (\text{repeat } S \text{ until } b), s \rangle$
